## Aufgabenstellung für die Masterarbeit

Name, Vorname: Semendiak, Yevhenii

Studiengang: Master DSE

Matr. Nr.: 4 7 3 3 6 8 0

Thema:

From Parameter Tuning to Dynamic Heuristic Selection

### Zielstellung :

Metaheuristic-based solvers are widely used in solving combinatorial optimization problems. A choice of an underlying metaheuristic is crucial to achieve high quality of the solution and performance. A combination of several metaheuristics in a single hybrid heuristic proved to be a successful design decision. State-of-the-art hybridization approaches consider it as a design time problem, whilst leaving a choice of an optimal heuristics combination and its parameter settings to parameter tuning approaches. The goal of this thesis is to extend a software product line for parameter tuning with dynamic heuristic selection; thus, allowing to adapt heuristics at runtime. The research objective is to investigate whether dynamic selection of an optimization heuristic can positively effect performance and scalability of a metaheuristic-based solver.

For this thesis, the following tasks have to be fulfilled:

- Literature analysis covering closely related work.
- Development of a strategy for online heuristic selection.
- Implementation of the developed strategy.
- Evaluation of the developed approach based on a synthetic benchmark.
- (Optional) Evaluation of the developed approach with a problem of software variant selection and hardware resource allocation.

## 0.1 abstract

Abstract will be available in final versions of thesis.

## *Contents*

# 1 Introduction

**Intent and content of chapter.** This chapter is an self-descriptive, shorten version of thesis.

## 1.1 Motivation

Structure:

- optimization problem(OP) → exact or approximate (+description to both) → motivation to use **approximate solvers** →
- impact of parameters, their tuning on solvers → motivation of **parameter control** (for on-line solver) →
- but what if we want to solve a class of problems (CoP) → algorithms performance is different →
- user could not determine it [1] → exploration-exploitation balance
- no-free-lunch (NFL) theorem [2] → motivation of the thesis

**thesis motivation** The most related research field is Hyper-heuristics optimizations [3], that are designed to intelligently choose the right low level heuristics (LLH) while solving the problem. But the weak side of hyper-heuristics is the luck of parameter tuning of those LLHs [links]. In the other hand, meta-heuristics often utilize parameter control approaches [links], but they do not select among underlying LLHs. The goal of this thesis is to get the best of both worlds - algorithm selection from the hyper-heuristics and parameter control from the meta-heuristics.

## 1.2 Research objective

Yevhenii: Rename: Problem definition?

The following steps should be completed in order to reach the desired goal:

**Analysis of existing studies of algorithm selection.** *(find a problem definition, maybe this will do [1])*

**Analysis of existing studies in field of parameter control and algorithm configuration problems** *(find a problem definition) [4]*

**Formulation and development of combined approach for LLH selection and parameter control.**

## Evaluation of the developed approach with

Yevhenii: family of problems??? since it is a HH, maybe we should think about it...

.

**Research Questions** At this point we define a Research Questions (RQ) of the Master thesis.

- **RQ 1** Is it possible to select an algorithm and its hyper-parameters while solving an optimization problem *on-line*?
- **RQ 2** What is the gain of selecting and tuning algorithm while solving an optimization problem?
- **RQ 3?** How to solve the problem of algorithm selection and configuration simultaneously?

## 1.3 Solution overview

Yevhenii: Rename: Problem solution?

- described problems solved by HH, highlight problems of existing HHs(off-line, solving a set of homogeneous problems in parallel)
- create / find portfolio of MHs (Low level Heuristics)
- define a search space as combination of LLH and their hyper-parameters (highlight as a contribution)
- solve a problem on-line selecting LLH and tuning hyper-parameters on the fly. (highlight as a contribution? need to analyze it.)

**Thesis structure** The description of this thesis is organized as follows. First, in chapter ?? we refresh readers background knowledge in the field of problem solving and heuristics. In this chapter we also define the scope of thesis. Afterwards, in chapter ?? we describe the related work and existing systems in defined scope. In Chapter 4 one will find the concept description of dynamic heuristics selection. Chapter 5 contains more detailed information about approach implementation and embedding it to BRISE. The evaluation results and analysis could be found in Chapter 6. Finally, Chapter 7 concludes the thesis and Chapter 8 describe the future work.

## 2 Background and related work analysis

**The structure** is the same the beginning of introduction, but way more detailed.

### 2.1 Optimization problems and solvers

#### 2.1.1 Definition of optimization problems

Yevhenii: Need to find a classification of optimization problems.

#### 2.1.2 Optimization problems solvers

Yevhenii: rename to smth like "Types — Classes of solvers"

Some (but not only) literature: [5]

**Exact solvers**

**Approximate solvers**

**Comparison:**

Pros and cons of both [6]

### 2.2 Approximate solvers of optimization problems

TSP as the running example. I guess, I will introduce it as an example of perturbation problems in previous section.??

#### 2.2.1 Heuristics

**Definition**

**Examples**

**Conclusion**

Heuristics are strictly problem dependent and each time require adaptations.

### 2.2.2 Meta-heuristics

#### Definition

#### Classification

#### Examples

We distinguish following examples among all existing meta -heuristics, since later we use them as the LLH in developed hyper -heuristic.

**GA**

**SA**

**ES**

#### No-free-lunch theorem

NFL is the problem of heuristics[2]

#### Exploration-exploitation balance

#### Conclusion

Proper assignment of hyper -parameters has great impact on exploration-exploitation balance and those on (meta) -heuristic performance.

### 2.2.3 Hybrid -heuristics

#### Definition

#### Examples

**Guided Local Search (GLS) + Fast Local Search** [7]

**Direct Global + Local search** [8]

**Simulated Annealing + Local Search** [9]

#### Conclusion

### 2.2.4 Hyper -heuristics

#### Definition

#### Classification

**Search space:** heuristic selection, heuristic generation

**Learning time:** on-line learning hyper-heuristics, off-line learning hyper-heuristics, no-learning hyper-heuristics

**Other classification characteristics** from [1], [10], mb smth else. For instance, hyperparameter tuning

### Examples

[11] (Online algorithm selection at page 27); [1]

### Conclusion...?

they usually (need to check it) have lack of parameter control

### 2.2.5 Conclusion on approximate solvers

**Pros and cons of heuristics** - too problem dependent

**Pros and cons of meta -heuristics** - no LLH selection, strict to one problem

**Pros and cons of hybrid -heuristics** - no LLH selection, strict to one problem ?

**Pros and cons of hyper -heuristics** - no parameter control?

## 2.3 Parameter tuning

Yevhenii: The goal of section: analysis of existing systems for hyper -parameter optimization (tuning), weaknesses and strength of each of the system

Yevhenii: Should I include the analysis from the code-basis point of view? If no, I do not see what should I conclude from this section exact "there are number of parameter tuning systems each of them has pros and cons..

### 2.3.1 Parameter tuning problem definition, approaches (grid, random, mh..)

### 2.3.2 Systems for parameter tuning

#### IRACE

approach [12]

pros and cons

#### SMAC

approach description

#### BOHB

approach description

#### AUTO-SKLEARN

**CASH (Combined Algorithm Selection and Hyperparameter optimization) problem**

**pros and cons (on-line or off-line, problems to solve, extensibility)** [13]

## **BRISEv2**

### **approach description**

Yevhenii: Other systems?

### **Table for comparison**

### **Conclusion**

depends on the resolved question in todo...

## **2.4 Parameter control**

### **2.4.1 definition, approaches**

### **2.4.2 system examples**

### **2.4.3 Conclusion**

impact of parameter control based on other's evaluation

## **2.5 Conclusion**

The meta-heuristic systems designers reported positive impact of parameter control embedding. However, as the outcome of the no-free-lunch theorem, those systems can not tolerate broad range of problems, for instance, problem classes. In other hand, hyper-heuristics are designed with an aim to select the low level heuristics and those propose a possible solution of problem, stated in no-free-lunch theorem, but the lack of parameter control could dramatically decrease the performance of LLH (probably, I need to find a prove of this, or rephrase).

**Scope of work defined.** In this thesis we try to achieve the best of both worlds applying the best fitting LLH and tuning it's parameters while solving the problem on-line.

## 3 Concept description

**In this chapter** we describe the concept of developed selection Hyper -Heuristic with parameter control, not diving deep into the implementation details. The best practice in software engineering is to minimize an effort for the implementation and reuse already existing, well-tested and broadly used code. With this idea in mind we had decided to use one of previously created (and highlighted by us in 2.3) hyper -parameter tuning systems as the code basis and those turn it into the core of hyper -heuristic. We also reuse the set of already developed heuristics as the Low Level Heuristics for designed Hyper -Heuristic.

The structure of this chapter is as follows. First, we define the Search Space entity in 3.1, its requirements and structure. It should bound the world of Low Level Heuristics and the world of Hyper -parameters of those heuristics.

Second, we describe the Prediction process within the previously defined Search Space in 3.2. Here we highlight an importance of a prediction model decoupling from the previously defined Search Space structure. Doing so, we provide certain level of flexibility for user in the usage of different prediction models or developing his own.

Third, in 3.3 we gather our attention onto the Low Level Heuristics - a working horse of the hyper -heuristic. Here we highlight the requirements for LLH in terms of features that will be used by HH.

Later, we select the code basis. We analyze the existing systems and highlight important non-functional characteristics for ?? hyper -heuristic and 3.4.2 low level heuristics set.

Finally, in 3.5 we conclude this chapter with the analysis of required changes, that are needed to be accomplished for turning code base system into the hyper -heuristic.

### 3.1 Search Space

**Importance explanation**

**Required structure** feature-tree structured

### 3.2 Prediction process

**Importance explanation**

**Requirements** generality, top-down approach of optimization – different views of same Configuration (level-dependent) - filtering, transformation – consider problem features? while selecting meta-heuristic [1] page 6

### 3.3 Low Level Heuristics

**Importance explanation**

#### Requirements

## 3.4 Code basis selection

With the aim of effort reuse, the code base should be selected for implementation of the designed hyper-heuristic approach.

### 3.4.1 Hyper-Heuristics Code Base

A.k.a. "brain". Need to find a better way to call this part of HH..

#### Requirements

##### Parameter tuning frameworks

SMAC

BOHB

IRACE

BRISv2

Yevhenii: Maybe, smth else..

#### Conclusion

BRISv2 is the best system for code basis.

### 3.4.2 Low Level Heuristics

#### Requirements

##### Heuristic frameworks

-table and short comparison of checked repositories

SOLID

MLRose

OR-tools

pyTSP

LocalSolver

jMetalPy

## **Conclusion**

jMetalPy is cool!

## **3.5 Scope of Required Changes**

### **3.5.1 Search Space**

highlight - should be done in feature-tree structured search space

#### **Current state description**

What is the problem with the current Search Space?

#### **Scope of work analysis:**

throw away and write a new one :D

### **3.5.2 Prediction Process**

highlight - should be done in feature-tree structured search space

#### **Description of current state**

##### **Heterogeneous data?**

short description of data preprocessing

#### **Scope of work analysis**

### **3.5.3 Low Level Heuristics**

#### **Description of current state**

#### **Scope of work analysis**

### **3.5.4 Conclusion?**

we selected BRISEx2, jMetalPy because they are cool. the amount of work is vast so lets dive into it in the next chapter!

### 3 *Concept description*

## 4 Implementation details

Yevhenii: I am more concern to put it into the appendix..

**In this chapter** we define the implementation details of the selection hyper-heuristic with parameter control. You could find here a code snippets as well as the class diagrams.

### 4.1 Search Space

#### 4.1.1 Description of base version (in BRISv2)

#### 4.1.2 Implementation

Description

Motivation of structure

Class diagram

### 4.2 Data preprocessing

Unified data types (pandas Data Frame)

Sklearn preprocessor wrapper

### 4.3 Prediction logic

#### 4.3.1 Predictor

to decouple prediction from structure of search space.

#### 4.3.2 Prediction models

Tree parzen estimator

Multi Armed Bandit

Sklearn linear regression wrapper

### 4.4 Low Level Heuristics

#### 4.4.1 Meta-heuristics repository

Available Meta-heuristics

#### *4 Implementation details*

**opened PR**

# 5 Evaluation

## 5.1 Problem

which problem I wanna solve with hyper-heuristic

- TSP
- n-Queens
- knapsack

Reviewer: what will you compare?

## 6 Conclusion

Reviewer: answer research questions

## 6 *Conclusion*

## 7 Future work

add more sophisticated models

dependencies / constraints in search space

add new class of problem (jmetalpy easily allows it)

evaluation on different types and classes

Reviewer: consider merging with conclusion, if too short

Yevhenii: is it correct style?

Reviewer: better the one with first letters of family names and year

## 7 *Future work*
